

## CHALLENGE FOUR COMPONENTS

The task of four components, designed to solve the relationship between material values: “stock”, “cryptocurrency”, “gold”, “money”, which also generate financial income:

The essence of the task is as follows:

It is necessary to establish such a conversion ratio between all the specified quantities, as a result of which one material quantity, being transformed into another quantity, according to the specified schedule, creates the possibility of receiving additional income as a result of such a transformation.

When one of the four components is transformed into any of the other mentioned components, the magnitude of the same material quantity changes relative to the transformed one.

By performing such an operation with the number of relations indicated in the graph, we obtain an additional result several times larger, which exceeds the basic result in geometric progression.
